

The Ant Implementation Method

Our collaborative process for designing irrigation systems that are easier to operate, easier to maintain and built for long-term performance.

3

COLLABORATIVE DESIGN

Onboarding
Confirm background and align the team

Concept Design
Develop design concepts and requirements

Site Visit 1
Review site conditions, gather input, align operations team

Final Design Package
Deliver final drawings, BoQ and design report

Site Visit 2
Validate design, refine and confirm final approach

Detailed Design
Develop and optimise detailed design

 **Early Design Review: 2 weeks** after project kick-off, you'll receive a draft concept so you can tell us what works, what doesn't, and what needs to change before detailed design.

We align on objectives, constraints and outcomes before design begins

Design only starts once all required information has been received and approved

Iterative collaboration ensures the design is practical, buildable and aligned with your operation
