

– For large-scale agriculture across Africa and the Middle East

Independent water engineering for large-scale agriculture

Ant Consult designs irrigation, pumping and water distribution systems built for the lowest possible cost of ownership. Every design is shaped by the realities of your operation, and the people who will manage it.

Let's talk
View projects

TRUSTED BY GROWERS, CORPORATES AND DEVELOPERS ACROSS TWO CONTINENTS

Mouton citrus · nadec · Value Chain Solutions · L&A · URBAX · African Crane Projects · Covered Consulting

An irrigation system is a 20 to 30 year commitment.

At Ant Consult, every design decision is made with one goal in mind: the lowest possible cost of ownership over the life of the system. That means practical engineering that reduces operating costs, supports efficient management, and delivers reliable performance for decades.

Lifecycle Cost = Capital Cost (CAPEX) + Operational Cost (OPEX) over the lifetime of a system

70–80% OPEX, not CAPEX	50% Saving	3–5 Yrs Payback
Of the total irrigation and water system lifecycle cost lies in OPEX. We design for lowest possible OPEX, not	Electricity cost reduction over system lifetime by sizing systems for the lowest lifecycle cost, not lowest possible CAPEX.	Payback period on CAPEX to install a lifecycle cost optimised system. Beyond this is profit.

– WHO WE SERVE

If water is central to your operation, this is for you.

When you're making a capital investment that will shape your operation for decades, independent engineering advice matters.

Our recommendations are based on what's right for your operation, not on the equipment being sold.

Commercial Growers
How we work with commercial growers

Agricultural Corporates

– OUR EXPERTISE

Engineering across the full life of a water system

Feasibility studies
Evaluate project viability before committing capital. We assess development options against real financial metrics so you can invest with confidence, or redirect before it costs you.
LEARN MORE ⟶

Masterplans
A phased development plan built around your operation. We turn feasibility studies into practical implementation plans that align technical priorities with financial reality.
LEARN MORE ⟶

Commercial irrigation design
The right system for your crop, your land, your operation. We design drip, micro, centre pivot and sprinkler systems that are practical, reliable and engineered to minimise lifetime operating costs.
LEARN MORE ⟶

Irrigation upgrades
Improve performance without replacing what still works. We assess low pressure, uneven application and ageing infrastructure to identify targeted upgrades that deliver the greatest return on investment.
LEARN MORE ⟶

Bulk water supply
Move water efficiently from source to scheme. We design bulk pipelines and pump stations engineered for reliable operation, low lifecycle cost and straightforward maintenance.
LEARN MORE ⟶

System Assessments
Identify problems before they become expensive failures. We assess hydraulic performance, operational constraints and system reliability to recommend practical improvements that extend the life of your infrastructure.

– IN THEIR WORDS

Engineering our clients can build on

> With your engineering mind, you were able to solve it. I think it was a very direct approach, solution-driven.
>
> **Noel Stevens**
> Director

> Your lightweight service is appealing. We have used big consultants and never felt like we were on top of their priority list.
>
> **Alex Blaker**
> Senior Engineer

> The design you did was very professional and added a lot of value. Your engagement and quick communication also added a lot of value in bringing everyone together.
>
> **Client Engineer**
> Engineer

What can we help you achieve?
